

## NERDC Conducts a Technology Dissemination session on Cinnamon Oil Distillation Unit

National Engineering Research and Development Center recently conducted a technology transfer session for the small scale entrepreneurs whom are engaged in Cinnamon Industry. This was conducted by the Techno Marketing Department of NERDC and held at the Technology Park of the Centre. This Cinnamon Oil Distillation Unit which is introduced by NERDC, provides many benefits to the Cinnamon

oil manufacturers, over the traditional type

huge cinnamon oil distillation unit. During the process, although the temperature of the water used in the process is goes at a very high level: but in this unit it never happens. Very less space is required to install this unit compared to the traditional one. Fuel cost is highly reduced compared to traditional unit, since this unit is operated using saw dust/paddy husk as the fuel. More over hence cinnamon oil is produced at a lower temperature, loss of oil due to evaporation. Hence these benefits this Cinnamon oil distillation unit is

highly accepted by small scale cinnamon oil producers.

It was a half a day session and it included seminar and demonstration & practical activities and entrepreneurs whom are interested to obtain the technology of manufacturing of this Cinnamon Oil Distillation Unit were encouraged to apply for the license from NERDC.
